GitHub Pages structure clarification

Claude finished the response

You said: I see all of this in the panel "1:06 AM Clarified GitHub Pages structure and debunked subrepo necessity Clarified GitHub Pages structure and debunked subrepo ...

I see all of this in the panel "1:06 AM Clarified GitHub Pages structure and debunked subrepo necessity Clarified GitHub Pages structure and debunked subrepo necessity Good question — and no, you don't need subrepos or for the Master repo to have its own GitHub Pages. Let me clear this up simply. The key concept GitHub Pages serves one repo as one website. Subfolders in that repo automatically become URL paths. So the entire site we just built is literally just one repo with folders in it: your-repo/ |—— index.html → decoryedwards.com/ |—— tutoring/ | |—— index.html → decoryedwards.com/tutoring/ |—— consulting/ | |—— index.html → decoryedwards.com/consulting/ |—— style.css |—— CNAME No subrepos. No complexity. One repo, one website, subfolders are URL paths. The real question: where does the website repo live inside Master? You have two separate concerns that shouldn't be tangled: /Users/dc/Dropbox/Master/ | |—— site/ ← THIS is its own GitHub repo → GitHub Pages → decoryedwards.com | |—— index.html | |—— tutoring/ | |—— consulting/ | |—— style.css | |—— CNAME | |—— business-docs/ ← The .md files we made (NOT a website, just files) | |—— README.md | |—— 01-vision.md | |—— ... | |—— tutoring-materials/ ← Problem sets, Overleaf exports, student notes site/ is the only folder that needs to be a GitHub repo with Pages enabled. business-docs/ and tutoring-materials/ are just Dropbox folders — they can be in a separate repo or no repo at all. Does Master itself need to be a repo? Only if you want version control on your business docs too, which is actually useful with Cursor/Cowork. But it doesn't need" did you do it

Claude responded: Let me check what's currently in your Master

folder to see the actual state of things.

Thought process

Thought process

Let me check what's currently in your Master folder to see the actual state of things.

Ran 2 commands

Ran 2 commands

No site files exist yet — the previous session's work was in a temporary folder that's been cleared. I need to build the 6 files fresh and place them directly in your Master folder. Let me first check your existing tutoring plan docs so the site content is accurate.

Read 3 files

Read 3 files

Good — I have everything I need. The site/ folder doesn't exist yet. I'll build all 6 files now directly into /Users/dc/Dropbox/Master/site/.

Created 6 files, ran a command

Created 6 files, ran a command

All 6 files are now in your Master folder. Let me verify the structure:

Ran a command

Ran a command

All 6 files are in place at /Users/dc/Dropbox/Master/site/. Here's exactly where things stand and what you do next:

Done — files are in your Master folder:

site/

- |—— index.html → decoryedwards.com/
- |—— tutoring/index.html → decoryedwards.com/tutoring/
- |—— consulting/index.html → decoryedwards.com/consulting/
- |—— style.css
- |—— CNAME
- |—— README.md

Three placeholders you fill in before deploying (search in tutoring/index.html):

1. [Rate TBD] × 3 — your actual session prices

2. YOUR_CALENDLY_URL — your Calendly link (free to create at calendly.com)
3. YOUR_FORM_ID — your Formspree endpoint (free at formspree.io) — also appears once in consulting/index.html

Accounts you need to set up (in order):

1. **Formspree** (free) — formspree.io → sign up → create a new form → copy the form ID. Takes 5 minutes. This activates your contact forms.
2. **Calendly** (\$10/mo Standard) — calendly.com → create account → create a 60-min event type → connect Stripe (see below) → copy the URL. This is your booking system.
3. **Stripe** (free to set up, 2.9% + \$0.30/transaction) — stripe.com → create account → connect to Calendly. This is how you get paid at booking.
4. **Google Workspace** (\$7/mo) — workspace.google.com → sign up with decoryedwards.com → this gives you decory@decoryedwards.com email, eSignature for contracts, and Google Forms for the intake questionnaire.

Once you fill in those 3 placeholders, the README has the exact git commands and DNS steps to push to GitHub and point your domain. Want me to walk through any of those steps in detail?

?? ??

You said: HOW do i edit the html directly next time, when i go to open it it says in google chrome and just renders the website.

HOW do i edit the html directly next time, when i go to open it it says in google chrome and just renders the website. As for the changes i want you to make. 1. Take linear algebra and differential equations off the list under mathematics. 2. Take off public economics for now. But somewhere in this repo "/Users/dc/Dropbox/Master/Tutoring/Plan/06-open-questions.md" add that i want to add as subjects public economics and writing with subsections creative writing and literature". 3. FOr test prep only say AB Calc BC calc stats micro and macro for the AP tests i can help with. no sat or anything like that. But add SAT and ACT to the list that i mentioned before in PAn. 4. Change this "I work primarily with minors. Every part of the process is designed so parents are always in the loop — not as an afterthought, but as a structural feature." - to say: "Because education is an institution with the development of youth at its core, a serious effort is made so that each tutoring session and the knowledge exchanged is readily available to parents and legal guardians." AND then change "Middle school through undergraduate. AP exams, college coursework, standardized test prep. Every session recorded and shared with parents — no black box." to say: "Middle school through undergraduate. Coursework and test prep (AP exams included). Every session recorded and shared with parents." 5. For the rates, change this. We are only covering middle school and high school levels of math. So make sure this is consistent everywhere on the site. Then put 30 for Non-AP maths/courses like pre algebra geometry etc. 40 for the AP versions of the course. 50 for any college

courses. Does this type of pricing make sense to do? Or should i just charge a flat rrate of 50? Perhaps I can charge a flat rate of 50 for all courses and then charge variables rates for test prep? consult with me on this last one before making that change.

Claude responded: Let me read the existing open-questions file first, then make all the edits.

Thought process

Thought process

Let me read the existing open-questions file first, then make all the edits. I'll tackle the pricing question with you before touching the rates table.

Read a file

Read a file

Good. Now I have everything I need. Let me make all the changes except the rates table (which I'll consult with you on after), then give you my pricing take.

Edited 3 files

Edited 3 files

Now the two text changes:

Edited 2 files

Edited 2 files

Now update 06-open-questions.md with the subjects to add later and SAT/ACT:

Edited a file

Edited a file

All 4 changes are done. Now — **on pricing:**

Here's my honest take. The tiered model (\$30 / \$40 / \$50) has an internal logic problem: you'd be charging *less* for the students who need the most hand-holding. Pre-algebra with a 7th grader often requires more patience and session prep than an AP Calc student who just needs a specific concept unlocked. Tiering by difficulty level sounds intuitive but doesn't necessarily reflect your actual time cost.

The flat rate of **\$50 for all coursework** is cleaner and easier to defend to clients.

It also positions you at the lower end of the DC/Baltimore market (typical range for someone with your credentials is \$65–100+/hr), so you have room to raise it later once you have reviews and repeat clients. Starting at \$50 flat gives you a simple pitch: "one rate, no confusion."

For **test prep specifically**, a modest premium makes real sense — \$60–65 — because:

- AP exam prep is time-bound (the exam date creates urgency), which clients value more
- Families shopping for AP prep are specifically comparing you to Kaplan, Princeton Review, etc. — a slightly higher rate signals you're in that tier
- You'd likely spend more time on practice materials and tailored problem sets

So my suggestion before you commit: **\$50 flat for all coursework, \$60 for AP exam prep**. Simple, defensible, room to grow.

Want to go with that, or would you like to adjust the numbers before I update the rates table?

On editing the HTML directly: Chrome opens .html files by rendering them because it's a browser. To edit the raw code, right-click the file in Finder → **Open With** → **Visual Studio Code** (or Cursor, which you already use). Cursor is actually ideal for this since you already have it — just open the site/ folder in Cursor and you can edit any file directly and see syntax highlighting. You can also ask me to make any changes here and I'll edit the file for you, which is probably the faster path for most updates.

?? ??

You said: When you say create a new form, what is this exactly?

1. When you say create a new form, what is this exactly? 2. With calendly \$10, thats the only way i can set events with multiple time windows right? 60 minutes or 30 etc? 3. Yes to the pricing question, 50 and 60.

?? ?

Claude responded: Good, updating the rates table now and I'll answer your questions inline.

Thought process

Thought process

Good, updating the rates table now and I'll answer your questions inline.

Edited a file

Edited a file

Rates are updated. Now your three questions:

1. What is a "form" in Formspree?

Your HTML already has a contact form built — the fields for name, email, subject, message are all there. The problem is a static site can't process form submissions on its own (that requires a server). Formspree is the middleman: you sign up, they give you a unique URL like <https://formspree.io/f/xabcdefg>, you paste it into your HTML (one line), and from that point on whenever someone hits "Send message" on your site, Formspree catches the submission and forwards it to your email. That's the entire thing — it's just an email relay for your contact form. Free tier handles 50 submissions/month, which is plenty.

2. Calendly — do you need \$10/mo for multiple time windows?

Yes. The free tier locks you to exactly 1 event type. You'd want at minimum three: a 60-min standard session, a 60-min AP prep session, and a 30-min free intro call. That's already 3 event types, so Standard at \$10/mo is required. The other thing Standard gives you that matters: Stripe payment collection built into the booking flow, so clients pay at the time they book rather than you chasing them separately. That's worth the \$10 alone.

3. Rates — done. The table now reads: \$50 / 60 min for all coursework, \$60 / 60 min for AP prep, \$75 / 90 min extended coursework, \$90 / 90 min extended AP prep, free 30-min intro call. The 90-min prices are just 1.5x — clean and easy to explain to a parent if they ask.

Next concrete steps in order:

1. Sign up at **formspree.io** → create a form → grab your form ID → tell me and I'll drop it into both contact forms in 30 seconds
2. Sign up at **calendly.com** → Standard plan → create your event types → connect Stripe → grab your Calendly URL → tell me and I'll drop it into the booking section
3. Then push site/ to GitHub and point the domain

Want to do those now and just paste the IDs here when you have them?

You said: I uploaded a screenshot.

Image

Image

1. I uploaded a screenshot. Tell me what to do there i dont want to mess this up. What should Form name and Project name be? 2. To set up stripe, its asking for a business name. Should I just put Decory Edwards? I am trying to coordinate it with the fact that i have the domain decoryedwards.com but i havent made any email addresses to receive mail yet. I want it to where the multiple emails can be made, if you check the conversation history youll see a thread about stuff like customersupport@ or tutoring@. I think i need to know how many emails like this i will need. For the tutoring and also for consulting. Or is this just for the business account so it can just be my name.

Show more

Claude responded: Screenshot 1 — Formsprees:

Thought process

Thought process

Screenshot 1 — Formsprees:

- **Form Name:** Tutoring Contact Form — this is just a label for you inside Formsprees so you know what it is. Name it something clear.
- **Project:** Rename "My First Project" to decoryedwards.com — again just organization on their end, doesn't affect anything on your site.
- **Send emails to:** It's already showing your Gmail — that's correct for now. Every contact form submission will land in your inbox. Hit **Create Form**, then on the next screen copy the form endpoint URL (it'll look like <https://formsprees.io/f/xxxxxxx>) and paste it here. I'll drop it into both contact forms in the HTML.

Screenshot 2 — Stripe:

For business name, put **Decory Edwards**. Here's why that's the right call: You're currently a Maryland sole proprietor, which means legally *you are the business* — there's no separate entity name. "Decory Edwards" is your DBA. It also matches your domain, which keeps everything coherent. When clients see a Stripe charge on their card statement it will show "Decory Edwards," which is professional and unambiguous.

On the email question — Stripe is completely separate from email. It just needs a name and your existing Gmail to send receipts to you. Don't let the email question hold up Stripe setup.

For the emails themselves: as a solo operator starting out, you only need **two** addresses through Google Workspace:

- decory@decoryedwards.com — your primary professional address for everything (client communication, contracts, receipts)
- tutoring@decoryedwards.com — what you put on the website's contact form so clients reach a subject-specific inbox

That's it for now. [consulting@](mailto:consulting@decoryedwards.com) can wait until consulting is actually active — there's no client to email yet. [support@](mailto:support@decoryedwards.com) is for companies with a support team, which you're not. Two addresses, \$7/mo for Workspace, done.

So your action right now: put **Decory Edwards** in Stripe, United States, hit Continue, and finish that setup. Then come back and share the Formsprees form ID.

You said: i used formspree and it said this "I have created a Formspree form with the endpoint:

Image

1. i used formspree and it said this "I have created a Formspree form with the endpoint: <https://formspree.io/f/xaqkaeng> What follows are a set of integration guides for different environments: Basic HTML, Vanilla JS (Ajax), and React. Please pick the guide that best matches my website and hosting environment. The guides include simple examples for how to integrate with Formspree but you should use form code tailored to my needs. --- # Basic HTML Point your form's action attribute at the Formspree endpoint and set the method to POST: `html <form action="https://formspree.io/f/xaqkaeng" method="POST"> <input type="email" name="email" required /> <textarea name="message" required></textarea> <button type="submit">Send</button> </form>` For more information on special fields and configuration options, see <https://help.formspree.io/hc/en-us/articles/360013470814-Submit-forms-with-JavaScript-AJAX> --- # Vanilla JS (Ajax) This is a guide for connecting a Vanilla JS form to Formspree using AJAX. For convenience, use the @formspree/ajax JavaScript library which provides a concise, declarative SDK for managing form state, responding to Formspree errors and manipulating the DOM. ## CDN (no bundler needed) `html <div data-fs-success></div> <div data-fs-error></div> <form id="my-form"> <label for="email">Email</label> <input type="email" id="email" name="email" data-fs-field /> <span data-fs-error="email"></span> <label for="message">Message</label> <textarea id="message"`

Thought process

Thought process

Both are easy — let me do the Formspree update now while I answer Stripe.

Edited 2 files

Edited 2 files

Formspree is live in both contact forms. ✓

**On the Stripe screenshot:** The website field already shows `https://decoryedwards.com` — that's exactly right. GitHub Pages is just the *hosting infrastructure*; the website address clients will actually see is `decoryedwards.com`. Stripe doesn't care where the files live, only what URL represents your business. Leave it as is.

For **"What does your business do?"**, type something like:

I provide one-on-one online tutoring in mathematics and economics to middle school, high school, and college students. Sessions are conducted via Zoom and clients pay at the time of booking.

That description helps Stripe classify your account correctly (education services, not retail or marketplace) which matters for their fraud detection. Hit Continue.

**Where you are now:**

-  Formspree done — contact forms are wired up
-  Stripe — finish the setup wizard (they'll ask for your SSN/EIN at the end for tax purposes — as a sole proprietor you use your SSN, that's normal)
-  Calendly — sign up, create event types, connect Stripe, paste the URL here
-  GitHub repo + DNS → site goes live

**You said: I provide one-on-one online tutoring in mathematics and economics to middle school, high school, and college students.**

1. I provide one-on-one online tutoring in mathematics and economics to middle school, high school, and college students. Sessions are conducted via Zoom and clients pay at the time of booking. - but i dont understand. If you have the website and then the tutoring is like a subpage, the Master repo made `decoryedwards` right, and then theres a subfolder with tutoring. why does `decoryedwards.com` point directly to the tutoring site, shouldnt there be a homepage

**Claude responded: You're right to question that — but the structure**

**is actually exactly what you described.**

Thought process

Thought process

You're right to question that — but the structure is actually exactly what you described. decoryedwards.com does have a homepage. Here's the full picture:

decoryedwards.com/ → index.html (homepage — the hub with all 3 cards)

decoryedwards.com/tutoring/ → tutoring/index.html (full tutoring page)

decoryedwards.com/consulting/ → consulting/index.html (consulting stub)

The homepage we built has your bio, a card for tutoring, a card for consulting, and a card linking to your research site. That's the landing page anyone hits when they type your domain. The tutoring page is a level deeper.

For Stripe, decoryedwards.com is just saying "this is the website for my business" — it's not pointing to the tutoring subpage specifically. Stripe only uses it to verify that a real website exists for this business. They don't care what the subpage structure looks like.

The description I gave you ("I provide one-on-one online tutoring...") is still accurate for Stripe because tutoring is the only *active* service right now — consulting and financial are just placeholder pages. Stripe wants to know what you're actually charging people for.

So nothing is wrong. decoryedwards.com = your business domain. The homepage is there. Tutoring lives at /tutoring/. Put https://decoryedwards.com in Stripe and continue.

?? ??

**You said: okay im at this part of the stripe setup.**

Image

okay im at this part of the stripe setup. I cant tell what i should do for this payment option, should i connect to a platform or use one of the checked boxes? or "I want a different setup"

???

**Claude responded: Keep both checked boxes exactly as they are and hit Continue.**

Keep both checked boxes exactly as they are and hit **Continue**.

Here's why each one applies to you:

**Non-recurring payments** — this is how Calendly will charge clients at booking.

Each tutoring session is a one-time payment, not a subscription. This is the main one you need.

**Invoicing** — useful for when you occasionally need to send a payment link directly, like if a parent wants to pay for a package of sessions upfront outside of Calendly, or if a consulting client needs a formal invoice later. Worth having enabled even if you don't use it immediately.

**"Connect to a platform instead"** — this is for marketplaces that process payments on behalf of other businesses (like if you were building your own version of Varsity Tutors where other tutors get paid through your platform). Not you.

**"I want a different setup"** — only if you needed subscriptions or something more exotic. You don't.

So: both boxes checked, hit Continue.

????

**You said: I had cursor ai tell me what the usefulness of integrating stripe with AI tools is, and this is what it said "Concrete demo: a**

## correct checkout starter

I had cursor ai tell me what the usefulness of integrating stripe with AI tools is, and this is what it said "Concrete demo: a correct checkout starter Your workspace had no Stripe integration yet, so I used the plugin end-to-end to scaffold one at /Users/dc/stripe-checkout-starter:

1. Queried the Stripe MCP for current Checkout + webhook guidance (API version 2026-04-22.dahlia).
2. Applied best-practice rules from the skill:
  - Checkout Sessions for one-time payments (not legacy Charges API)
  - No payment\_method\_types — dynamic payment methods enabled from the Dashboard
  - Webhook signature verification on checkout.session.completed
  - Restricted API key recommended in .env.example
3. Created a runnable starter with Express, a pay button, and webhook handler. To try it: `cd ~/stripe-checkout-starter cp .env.example .env` # add your `rk_test_...` and `whsec_...` keys `npm start` # open <http://localhost:4242> For local webhooks: install the Stripe CLI (`brew install stripe/stripe-cli/stripe`), then run `stripe listen --forward-to localhost:4242/webhook`. Why this is valuable: Instead of generic Stack Overflow snippets that often use deprecated patterns (Charges API, hardcoded card-only, unverified webhooks), the plugin pulled current docs and enforced 2026 rules — so the starter you got is production-aligned from the first line. When you add subscriptions, Connect, or upgrade an old integration, the same skills and MCP keep answers aligned with Stripe's latest APIs." can you undo this? I dont want to add anything yet so i can add stuff step by step and understand what everything does. That said, i decided to integrate stripe with claude and cursor and chatgpt, it isnt available for codex right now.

Show more

**Claude responded: Let me check if that folder exists and remove it.**

Thought process

Thought process

Let me check if that folder exists and remove it.

Ran a command

Ran a command

That folder is outside my mounted workspace so I can't delete it directly, but it's easy — open Finder, go to your home folder (/Users/dc/), and you'll see stripe-checkout-starter. Drag it to the trash. It's just a standalone folder Cursor created; it has no connection to your Master repo or your site, so deleting it has zero effect on anything we've built.

On the broader point — you're right to want to go step by step. That Cursor output is a good example of what *not* to do right now: it generated a full Express server with webhook handlers for a business that hasn't taken its first payment yet. You don't need any of that. The actual Stripe integration for your use case is handled entirely by Calendly — you connect your Stripe account inside Calendly's settings, and Calendly handles the checkout flow. No code required on your end.

The Stripe MCP being connected to Claude/Cursor/ChatGPT is useful later — for things like pulling payment reports, issuing refunds, or checking your balance without logging into the dashboard. But for setup, just use the Stripe dashboard directly as you're doing now.

Keep going through the Stripe setup wizard. Once that's done, the remaining steps are:

1.  Formspree — done
2.  Stripe — finish the wizard
3.  Calendly — sign up, create event types, connect Stripe
4.  GitHub repo + DNS → site goes live

**You said: okay so i finished stripe up tot he point where it has me in the sandbox.**

okay so i finished stripe up tot he point where it has me in the sandbox. it says i can go to live website when im ready. i think i want to spend time here seeing how all of this works in stripe. Then i will subscribe for calendly since its a monthly service. Does this make sense? or should i go ahead and move over to calendldly and set up the account even bfore i move stripe from sandbox to live

**Claude responded: Yes, this makes total sense — and actually the order you're describing is the right one.**

Thought process

Thought process

Yes, this makes total sense — and actually the order you're describing is the right one. Here's the logic:

**Explore Stripe sandbox first.** This is genuinely worth your time. The sandbox lets you run fake payments, see how the dashboard looks when money comes in,

understand what a refund looks like, see how a dispute appears. All of this with test card numbers, no real money. You want to feel comfortable in there *before* your first real client pays you — not be learning the dashboard at the same time you're dealing with an actual person.

**Don't subscribe to Calendly yet.** Here's the key thing: you can create a free Calendly account right now and configure everything — your availability windows, event types (60-min session, 90-min session, 30-min intro call), the intake questions you ask new clients — all of that setup work is free. The \$10/mo Standard plan only becomes necessary the moment you want to (a) have more than one event type live simultaneously and (b) collect payment through Stripe at booking. So create the account and build it out, but don't pay for Standard until the site is actually live and you're ready for a real client to book.

**The sequence that makes sense:**

1. Spend time in Stripe sandbox — understand the dashboard, run a few test payments with the test card number 4242 4242 4242 4242
  2. Create Calendly free account — configure event types and availability
  3. Push the site to GitHub and get the DNS pointed at it
  4. Flip Stripe to live, connect it to Calendly Standard — this is your launch moment
  5. First real client books → you see how the full flow works end to end
- You're not losing anything by doing it in this order, and you'll understand each piece before moving to the next. That's the right instinct.

☐☐☐☐

**You said: Update this sequence "Spend time in Stripe sandbox — understand the dashboard, run a few test payments with the test card number 4242 4242 4242 4242"**

Update this sequence "Spend time in Stripe sandbox — understand the dashboard, run a few test payments with the test card number 4242 4242 4242 4242"

- Create Calendly free account — configure event types and availability
  - Push the site to GitHub and get the DNS pointed at it
  - Flip Stripe to live, connect it to Calendly Standard — this is your launch moment
  - First real client books → you see how the full flow works end to end"
- after pushing the site to GitHub i want to focus on this repo `"/Users/dc/Dropbox/Master/Tutoring/Teaching"` basically notice how intro and macro theory have a syllabus in there and other information. I want to make otherr folders and subrepo for all the classes im saying iwill tutor for. importantly, check this out: `"/Users/dc/Dropbox/Academic"` read everything in here very slowly. You should be able to find syllbis and other things in there. Keep track of whats there, but the main goal here is to

pull syllabi specifically. So that we can mirror those folders i mention. I jsut want to have a reference for each course if possibe. Then for the middle school high school maths, try to find online free textbooks/ materials. WE can use that to create an original syllabus for these. as long as we cover all courses that students would go over in a ttypical school year both semesters, we should be fine. Then after this step of creating/ locating syllabi and making a folder for each course(IMPORTANT: We need to break them up into Math Stats Economics syllabi - then in there will be syllabi for the different subjects and or course difficulty distinctions, leave test prep blank or some way to refer to the AP prep materials online to create a study guide/syllabus -- this one should be more up to what the student wants to focus on for preparing for the exam). After this then folloow the rest of the steps we had after

Read 4 files

Good — I have the full picture of the Teaching folder. Before I build anything, one important note: **the /Users/dc/Dropbox/Academic folder is not mounted in my session** — I can only access what's inside Master. To let me read Academic, you'd need to open a new Cowork session and select that folder, or move/copy syllabi from it into Master manually.

What I *can* do right now with what I have:

- Two complete teaching plans already exist (Intro Macro, Intermediate Macro Theory)

- Mathematics, Statistics, and Test Prep folders exist but are empty
- I can build the full folder structure + reference docs for every course

Let me read the launch sequence file, then build everything.

Read a file

Now I have everything. Let me update the launch sequence first, then build the full Teaching folder structure with reference documents.

Created a file

Created a file

Now build the full Teaching folder structure with reference documents:

Ran a command

Ran a command

Looks like you sent without a message — I'll keep going and populate the reference documents for every folder I just created.

Created 13 files

Created 13 files

Now the Test Prep folders — these point outward to College Board resources rather than containing a fixed syllabus:
